Introduction

ALOPERS Observatory : SABCS 2009 – abs 3174

- ✓ from 05/2008 to 10/2009
 - ✓ 115 women with **Persisting Significant Alopecia (PSA)**
 - ✓ **almost docetaxel 75-100mg/msq**
 - ✓ 43% of PSA persists beyond 24 months after last course
 - ✓ Psychosocial damage for 47% of patients
- In France, docetaxel could induce PSA for **more than 100 women a year**

Patients and Methods

ERALOP objectives : to estimate the incidence of PSA through women point of view after (neo) adjuvant sequential chemotherapy or early breast cancer using CTCAE 4.0 classification :

- ✓ **Grade 1** : hair loss of **up to 50%** not obvious from a distance, a different hair style may be required to cover the hair loss
- ✓ **Grade 2** : hair loss > **50% with a psychosocial impact**

Statistical consideration : the sample size calculation of patients took into account : PSA incidence after TAC regimen of 3.2%, a 0.015 precision rate, a 0.05 α risk and a 0.20 rate of lost of follow-up, **at least 635 patients must be included.**

Patients eligibility :

- ✓ Treated in adjuvant or neo-adjuvant for early breast cancer
- ✓ With 3 or 4 courses of FEC (or EC 100) every 3 weeks
- ✓ Followed by 3 or 4 courses of docetaxel 100 mg/msq every 3 weeks

Self-questionnaires sent from july to october 2012

n = 829 (100%)

Self-questionnaires received

n = 665 (80.2%)

Self-questionnaires with medical data fully documented

n = 651 (78.5%)

164 pts who didn't answer were considered without PSA

Median age : 56 years [24-73]

Median follow-up : 3.7 years

Alopecia Grade (CTCAE 4.0)	6 months	3.7 years
0	310 (47.6%)	375 (57.6%)
1	270 (41.5%)	247 (37.9%)
2	71 (10.9%)	29 (4.5%)

Long term (3.7 years)
collateral sub-optimal regrowth

eyelash : 31%	nail disorders : 27%
eyebrow : 47%	pubic hair : 27%

Results

Logistic regression :

- **Age** : PSA risk increases with age OR = 1.04 [1.02–1.06] for 1 year ; 1.53 [1.21–2.03] for 10 years
- **Docetaxel dose reduction** : dose reduction (acute toxicity) is correlated with a PSA decrease (reversible alopecia) OR = 0.53 [0.30-0.89]

Conclusions and Perspectives

- Patients should be aware of this distressing side-effect
- Patients could be involved in chemo regimen choice (docetaxel vs paclitaxel)
- ALOPREV trial (SABCS 2012, Cancer Res 2012, 72, abs N°OT3-3-04) is the best option to prevent docetaxel PSA

After FEC

Cooling cap during docetaxel

Hair regrowth at the 3rd docetaxel course
